

From December 6th till December 12th the joint BSI / NVVI congress was held in in Liverpool (UK).

The meeting started with 2 bright spark sessions, one for PhD students and one for Postdocs, 2 career workshops followed by the official opening and keynote lecture. On the second day the for me most interesting session was on the schedule, a session about unconventional T cells. This was a good session with 2 great talks of the invited speakers and this session showed that more and more research is done on unconventional T cells. In the evening was the first poster session in which I presented my poster. The third day was like the second day, a full day of plenary and parallel sessions and ended with the second poster session. The evening was reserved for the congress party. Friday was half a day which ended with the van Loghum lecture by Ton Schumacher.

The joint BSI/NVVI meeting was a great meeting to get an update about what people are working on in immunology. Furthermore, it was a good opportunity for networking and informal interactions.
